

Weekly Task	Classification	Rationale
Maintenance of my Expy Application	Collaborate with AI	AI helps me brainstorm solutions, review code, and debug issues, but I implement and verify all changes myself.
Maintenance of my Lumen Application	Collaborate with AI	AI assists with feature ideas and debugging while I make the final development decisions.
Study about Backend AI Engineering	Collaborate with AI	AI serves as a tutor by explaining concepts and answering questions, while I practice and validate my understanding through coding.
Study about JavaScript and TypeScript	Collaborate with AI	AI provides explanations and examples, but I reinforce my learning by writing and testing code independently.
Implement backend API endpoints	Collaborate with AI	AI helps design APIs and explain best practices, while I build, test, and refine the implementation.
Debug application errors and runtime issues	Collaborate with AI	AI speeds up troubleshooting by suggesting possible causes, but I verify every fix before applying it.
Read official documentation (Node.js, Express, TypeScript, AI SDKs)	Collaborate with AI	AI helps summarize documentation and clarify unfamiliar concepts, but I rely on the official documentation for the final reference.
Write technical documentation (README, project notes, reports)	Just Me	Documentation should accurately reflect my work and understanding, so I write and review it myself.
Manage Git and GitHub repositories (commits, branches, pull requests)	Just Me	Version control actions directly affect my projects, so I personally manage commits and repository history.
Review and test code before submitting or deploying	Collaborate with AI	AI can suggest improvements or identify potential issues, but I am responsible for the final testing and approval.

Weekly Task	Classification	Rationale
Plan features and roadmap for personal projects	Collaborate with AI	AI helps organize ideas and explore alternatives, while I prioritize features based on my project goals.
Organize weekly internship and academic tasks	Just Me	Prioritizing my schedule requires personal judgment based on deadlines and responsibilities.

1. Implement Backend API Endpoints

Success Definition

Done well means:

- The endpoint functions correctly according to the requirements.
- The implementation follows Express.js and REST API best practices.
- Error handling is implemented where appropriate.
- The endpoint is tested successfully using tools such as a browser, curl, or Postman.
- I can explain how the endpoint works and why I implemented it that way.

2. Debug Application Errors and Runtime Issues

Success Definition

Done well means:

- I identify the root cause instead of only fixing the symptom.
- The issue is resolved without introducing new problems.
- I verify the fix through testing.
- I understand and can explain why the bug occurred.
- I document any important lessons learned if the issue is significant.

Study Backend AI Engineering

Success Definition

Done well means:

- I understand the concept well enough to explain it in my own words.
- I build or modify a working example using the concept.
- I know when and why the concept should be applied.
- I can connect the concept to my internship or personal projects.
- I identified areas where AI helped me learn and where I needed to verify information independently.
